This is your brain on music

Mapping musical activity reveals what music stimulates the brain in the same way food, sex and drugs do

BY STEVEN FICK AND ELIZABETH SMILEY

IMAGINING MUSIC: Singing "Twinkle, Twinkle Little Star" in your head stimulates the auditory cortex even though you are not actually hearing the tune. The activity, however, occurs in small, discrete areas (1), and to a lesser degree than if you were actually listening. The inferior frontal gyrus (2) tends to be associated with retrieving memories and is thus stimulated as you recall "How I wonder what you are." Scientists believe the dorsolateral frontal cortex (3) is responsible for holding the song in working memory while it is being imagined.

READING MUSIC: The auditory cortex (1) is organized in terms of muted frequencies, with some cells responding to low frequencies and others to high. Moving from the inside part of the cortex to the outside, different kinds of analyses take place. In the core, basic musical elements, such as pitch and volume, are analyzed, while surrounding regions process more complex elements, such as timbre, melody and rhythm.

PLAYING MUSIC: Few activities use more of the brain than playing music. It requires complex feedback systems that take in information, such as pitch and melody, through the auditory cortex (1) and allow the performer to adjust his or her playing. The visual cortex (2) is activated by reading — or even imagining — a score, the parietal lobe (3) is involved in a number of processes, including computation of finger positions; the motor cortex (4) helps control body movements; the sensory cortex (5) is stimulated with each touch of the instrument; the pre-motor area (6) remains somewhat mysterious but helps perform movements in the correct order and time; the frontal lobe (7) plans and coordinates the overall activity; and the cerebellum (8) helps create smooth, integrated movements.

REACTING EMOTIONALLY TO MUSIC: When you get a shiver up your spine listening to a piece of music, the "reward" structures deep in your mid-brain, such as the thalamus (1), ventral tegmental area (2), orbitofrontal cortex (3) and anterior cingulate (4) are being stimulated. These are some of the same circuits that are activated when a hungry person eats, when an aroused person has sex or when a drug addict snorts cocaine. If you find a song pleasant, activity in the amygdala (5) is inhibited. This part of the brain is typically associated with negative emotion, such as fear.

Go chills up your spine singing the national anthem? Find your feet start to move when you hear ABBA's "Dancing Queen"? Does your heart stumble when you hear your favourite love song? Everyone can name a tune or two that stir their souls. While personal experiences shape musical tastes, scientists are discovering that we all use the same basic brain circuits to process music.

"Everyone responds to music," says Robert Zatorre, a neuroscientist at the Montreal Neurological Institute of McGill University who studies music's impact on the brain. "So there must be something in our brains that predisposes us to it."

Using MRI (magnetic resonance imaging) and PET (positron emission tomography), scientists have mapped the brain activity of volunteers listening to or playing music and have found that the brain essentially performs like an orchestra. Each instrument in an orchestra has a unique function, but when heard in isolation, we would hear less meaning. Conversely, if you could see an orchestra's full sound, the role of each instrument is difficult to isolate and decipher. "The brain is not a mosaic of independent little sections," says Zatorre. "It is the ensemble activity that yields overall patterns."

This research is helping us reveal the root of musical dysfunction and the brain's adaptation to playing music. About one in a hundred musicians suffer from a focal dystonia, for example, where one fingers begin to move together as if joined. In violinists, the portion of the motor cortex that controls the four fingers of the left hand, which do most of the work, seems to be enlarged. This adaptation helps the violinist play better, but scientists have found that too much practice can eventually lead to confused signals in the brain. As a result, the musician can no longer move the two digits independently.

But playing the complex neural interactions that occur in a brain under the influence of music has an even broader goal. It paves the way for understanding in areas of brain disorders. "To solve diseases such as Alzheimer's, we need to achieve a good understanding of the entire system," says Zatorre. "It's an exciting avenue, because it involves almost every brain system that is known to exist."

BRAIN
CONNECTIVITY

BRAIN INITIATIVE TIMELINE

2013:
- Obama announces BRAIN Initiative.
- NIH, NSF, and DARPA commit $100M for 2014.

2014:
- FDA and IARPA join.
- Initiative establishes long-term vision and research priorities.

2016 – 2020:
- $400M per year funding period dedicated to the development of new tools and technologies

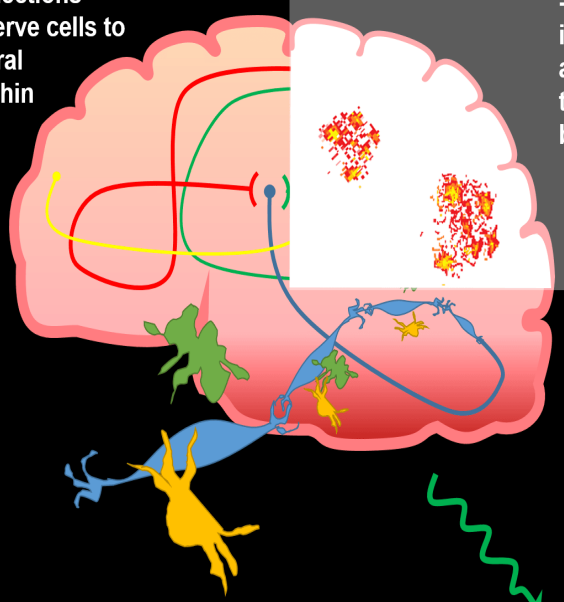
2021 – 2025:
- $500M per year funding period for application of new tools to study of the brain

RESEARCH PRIORITY AREAS

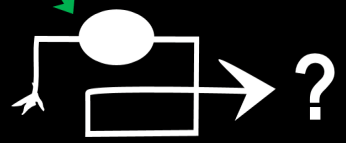
1) Brain Cell Types
- Identify the many different cells that comprise the brain and determine their functions

2) Tools for Circuit Diagrams
- Map connections between nerve cells to define neural circuits within the brain

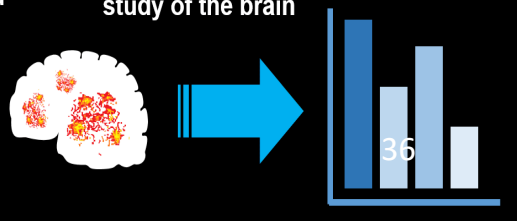
3) Technology to Monitor Neural Activity
- Monitor activity of individual nerve cells and neural circuits over the breadth of the entire brain simultaneously



4) Precise Interventional Tools
- Determine the role of different neural circuits in behavior by targeted manipulation



5) Theory and Data Analysis Tools
- Develop new methods to work with data acquired during study of the brain



6) Human Neuroscience
- Study the human brain and work toward treatments for disorders

7) Integrated Approaches
- Combine the tools and findings of other priority areas for a comprehensive understanding of brain function

FEDERAL PARTNERS

NIH — Development of new tools and techniques

NSF — Fundamental biology and technology development

DARPA — Rehabilitation of warfighters and civilians

FDA — Regulation of neurological medical devices

IARPA — Cognition and computation in the brain

Decade of the Mind

- **Success will require research that reaches across disparate fields such as:**
  - **Cognitive science**
  - **Medicine neuroscience**
  - **Psychology,**
  - **Mathematics**
  - **Engineering,**
  - **Neurotechnology**
  - **Computer science**

  Additional important insights will need to come from areas as diverse as :
  - **Systems biology,**
  - **Cultural anthropology**
  - **Social science**
  - **Robotics**
  - **Automation technology**

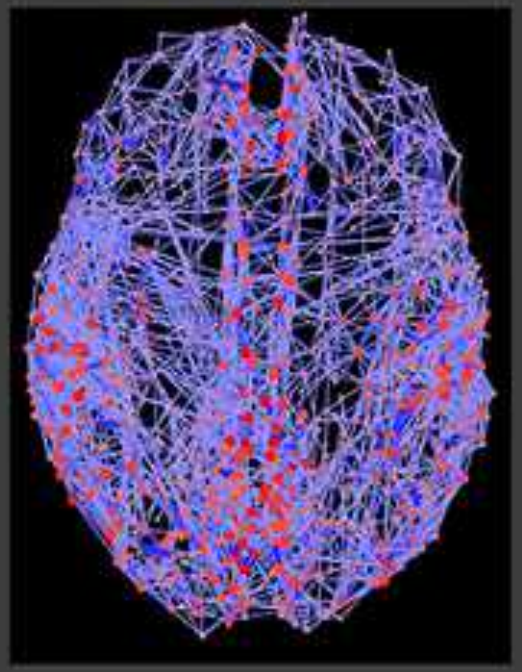
The Human Connectome

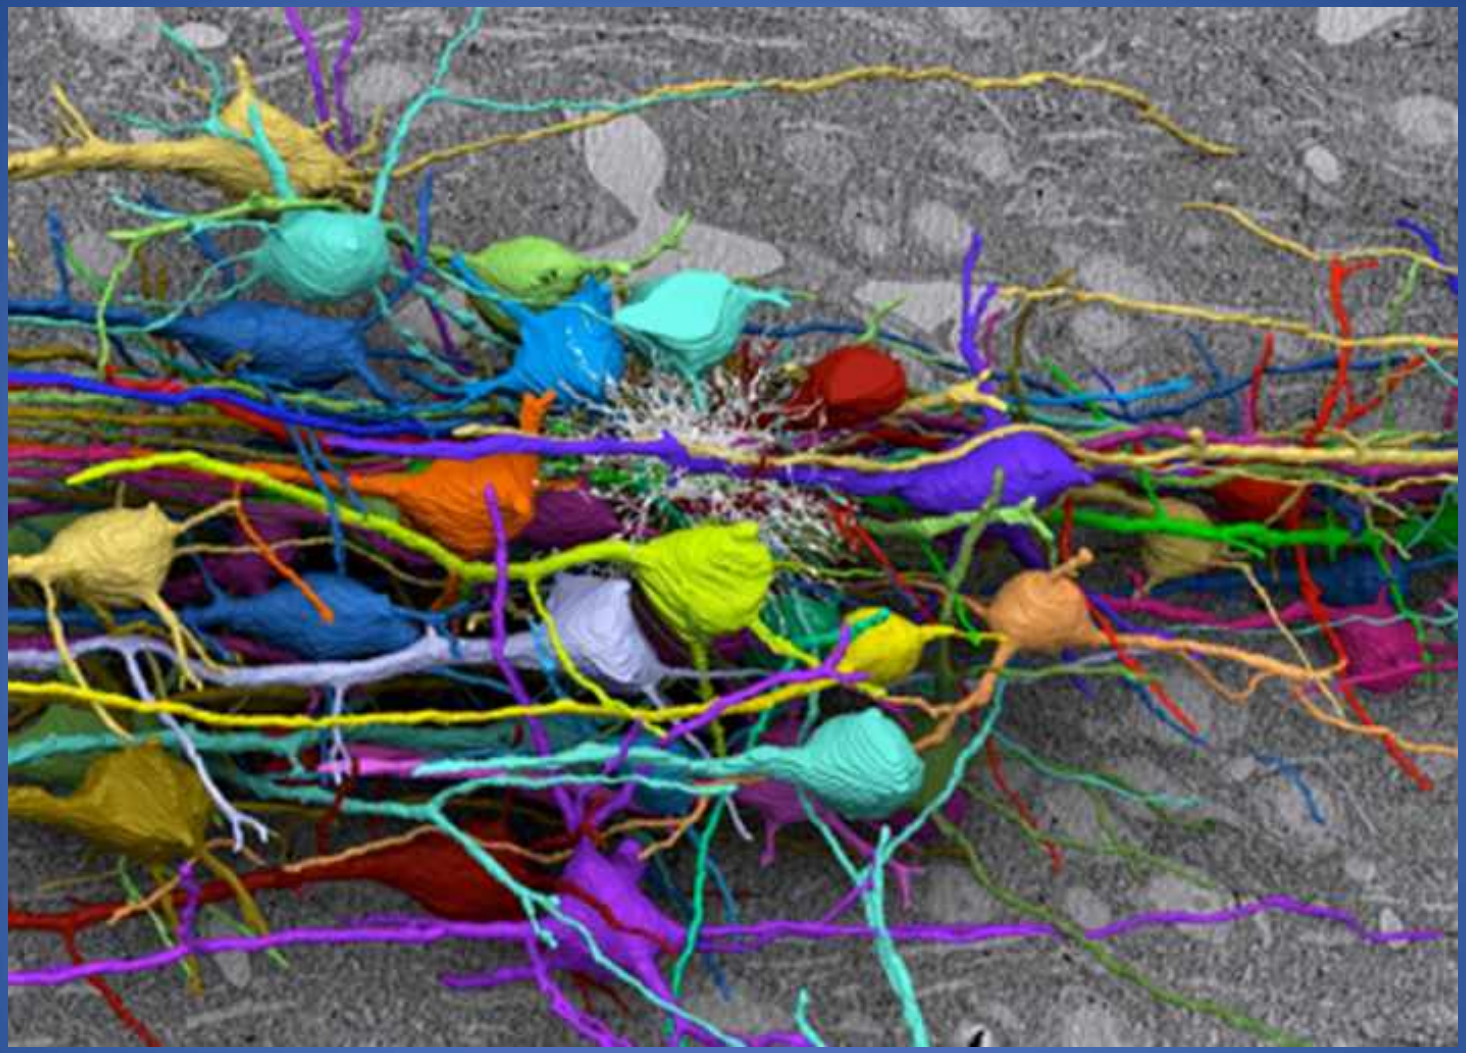
Anatomy
Klingler's method for fiber tract dissection uses freezing of brain matter to spread nerve fibers apart. Afterwards, tissue is carefully scratched away to reveal a relief-like surface in which the desired nerve tracts are naturally surrounded by their anatomical brain areas.



Connectome
Shown are the connections of brain regions together with "hubs" that connect signals among different brain areas and a central "core" or backbone of connections, which relays commands for our thoughts and behaviors.

Neuronal Pathways
A new MRI technique called diffusion spectrum imaging (DSI) analyzes how water molecules move along nerve fibers. DSI can show a brain's major neuron pathways and will help neurologists relate structure to function.

Connectome Computation



Connectome Computation

How a Fly Brain Detects Motion - MIT Technology Review

A reconstruction of 379 neurons involved in motion detection in the fruit fly.

By mapping the brain structure in such detail, the researchers gained new insight into how the brain detects movement. Their work is the latest example of many ongoing efforts in neuroscience to understand how the brain functions by building intricate diagrams of neuronal connections, or connectomes

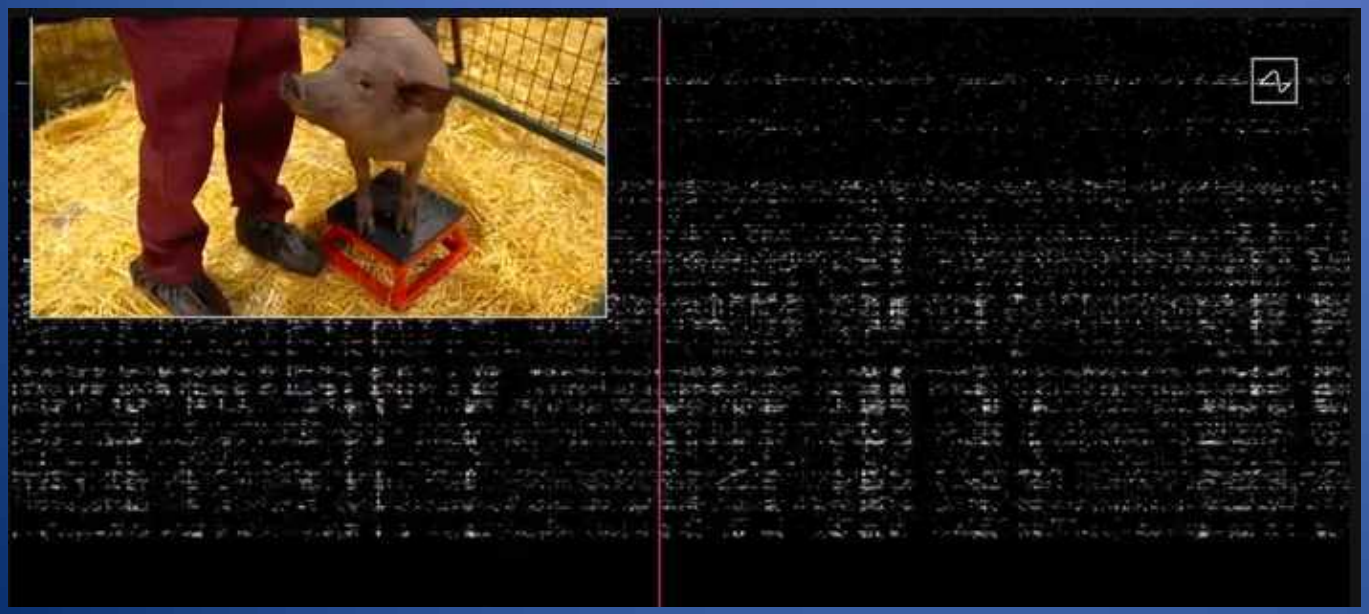
Elon Musk – Neuralink

The entrepreneur and Tesla founder unveiled the new design of the chip, as well as the full-scale surgical robot and a group of pig test subjects.

Elon Musk unveils updated Neuralink brain implant design and surgical robot



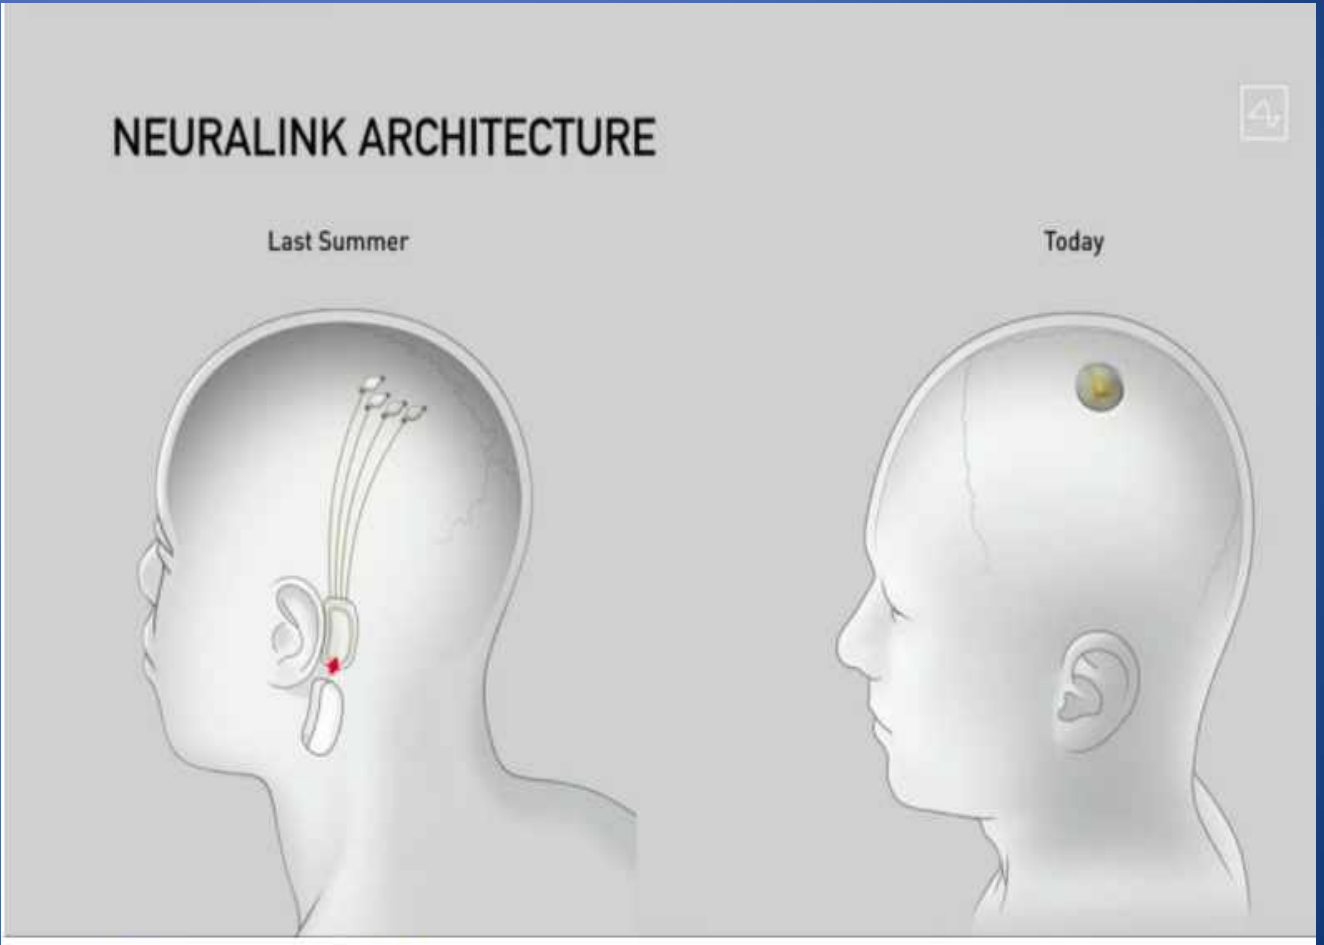
The robot pictured above has neuro-surgically inserted the chip into several pigs.

Visual to your left shows tiny EEG readings of real time activity in the brain.

Neuralink received a Breakthrough Device Designation from the FDA in July. The startup is now preparing for its first human implantation, pending required approvals and further safety testing.

Elon Musk's neuroscience startup **Neuralink** has revealed the **"dramatically simplified" design** for an implant that aims to create **brain-to-machine interfaces**.

Neuralink is developing to connect human brains with computer interfaces via artificial intelligence.



The Neuralink has been simplified from a device behind the ear to one on top of the skull

Article Natashah Hitti, 2 September 2020
https://www.dezeen.com/2020/09/02/neuralink-elon-musk-brain-implant-technology/

Elon Musk – Neuralink

- *The coin-sized chip would enable humans to control technology with their mind*
- **"It's kind of like a FitBit in your skull," said Elon Musk.**
- *The surgical robot is designed to be "comforting" for patients*
- *The implant could allegedly solve neurological disorders*
- **Musk also showed a pig that previously had a chip inserted into its brain, but had since been removed, to show that the procedure is reversible without any serious side-effects.**

Mapping Neuroplasticity ?

An astonishing new science called "neuroplasticity" is overthrowing the centuries-old notion that the human brain is immutable. - Norman Doidge, M.D.,

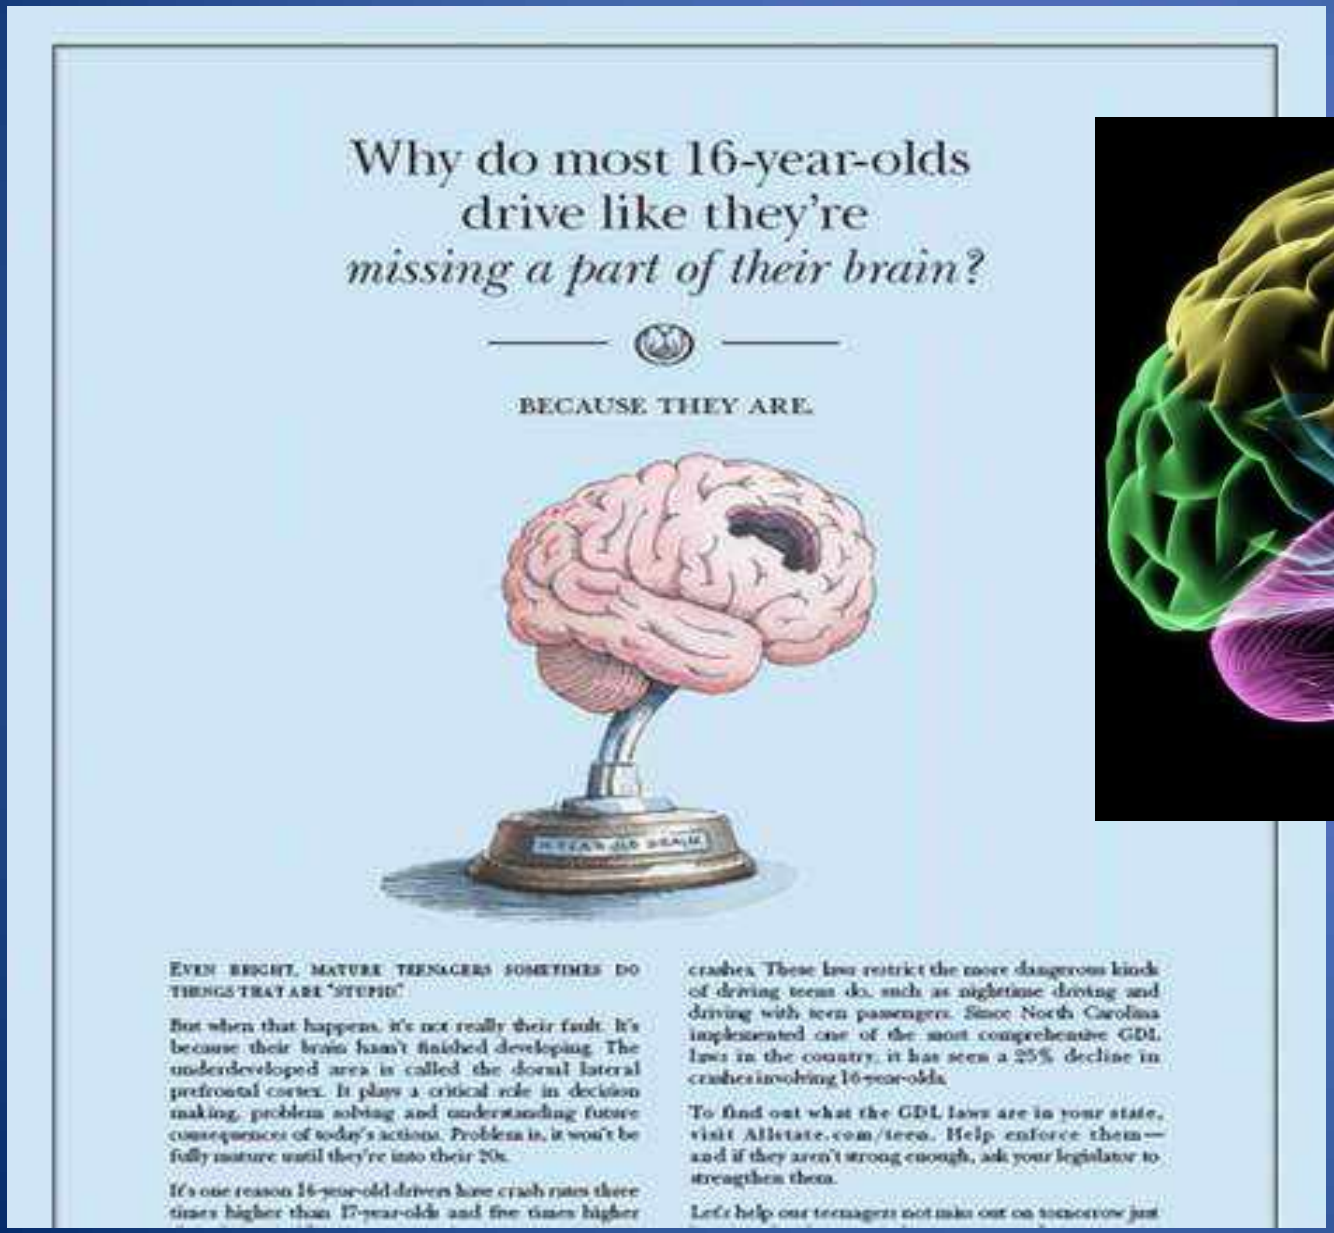
The Developing Pre-Frontal Cortex



Why do most 16-year-olds drive like they're *missing a part of their brain?*

BECAUSE THEY ARE.

EVEN BRIGHT, MATURE TEENAGERS SOMETIMES DO THINGS THAT ARE "STUPID."

But when that happens, it's not really their fault. It's because their brain hasn't finished developing. The underdeveloped area is called the dorsal lateral prefrontal cortex. It plays a critical role in decision making, problem solving and understanding future consequences of today's actions. Problem is, it won't be fully mature until they're into their 20s.

It's one reason 16-year-old drivers have crash rates three times higher than 17-year-olds and five times higher crashes. These laws restrict the more dangerous kinds of driving teens do, such as nighttime driving and driving with teen passengers. Since North Carolina implemented one of the most comprehensive GDL laws in the country, it has seen a 25% decline in crashes involving 16-year-olds.

To find out what the GDL laws are in your state, visit Allstate.com/teen. Help enforce them—and if they aren't strong enough, ask your legislator to strengthen them.

Let's help our teenagers not miss out on tomorrow just

Did you know...

An estimated

300-400

physicians die by suicide each year in the U.S.

The suicide rate among male physicians is

1.41

times higher than the general male population.

The suicide rate among female physicians is

2.27

times higher than the general female population.

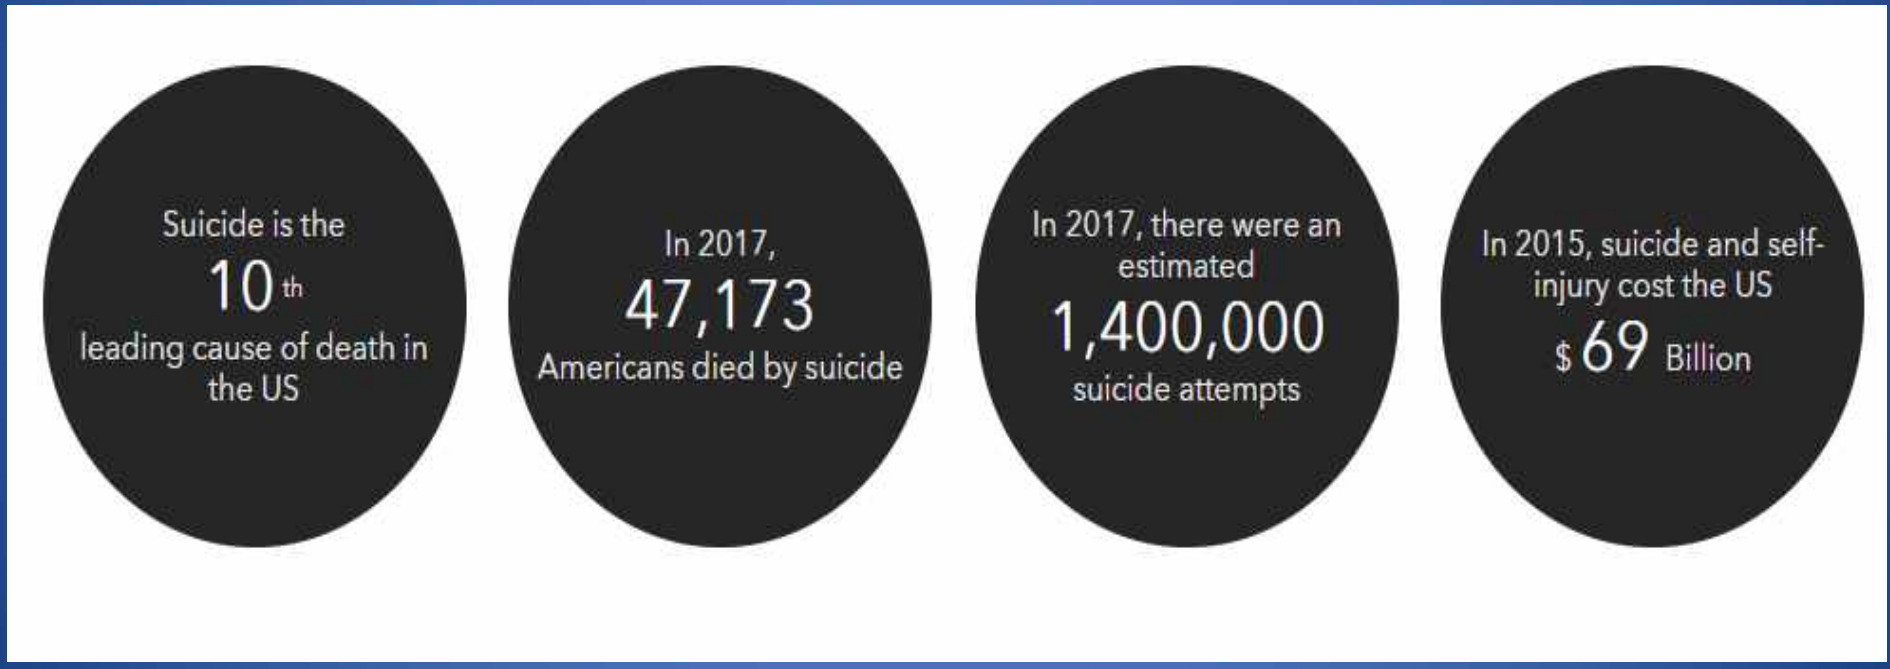
Physician Suicide

- Suicide generally is caused by the convergence of multiple risk factors — the most common being untreated or inadequately managed mental health conditions.

- Among physicians, risk for suicide increases when mental health conditions go unaddressed, and self-medication occurs as a way to address anxiety, insomnia or other distressing symptoms. Although self-medicating, mainly with prescription medications, may reduce some symptoms, the underlying health problem is not effectively treated. This can lead to a tragic outcome.

- Drivers of burnout include workload, work inefficiency, lack of autonomy and meaning in work, and work-home conflict.

American Foundation for Suicide Prevention



On average, there are 129 suicides per day.

2017

- **USA Homicide 2017 – 17, 284**
- **USA Suicides 2017 – 47,173**

The Brain in Your Gut

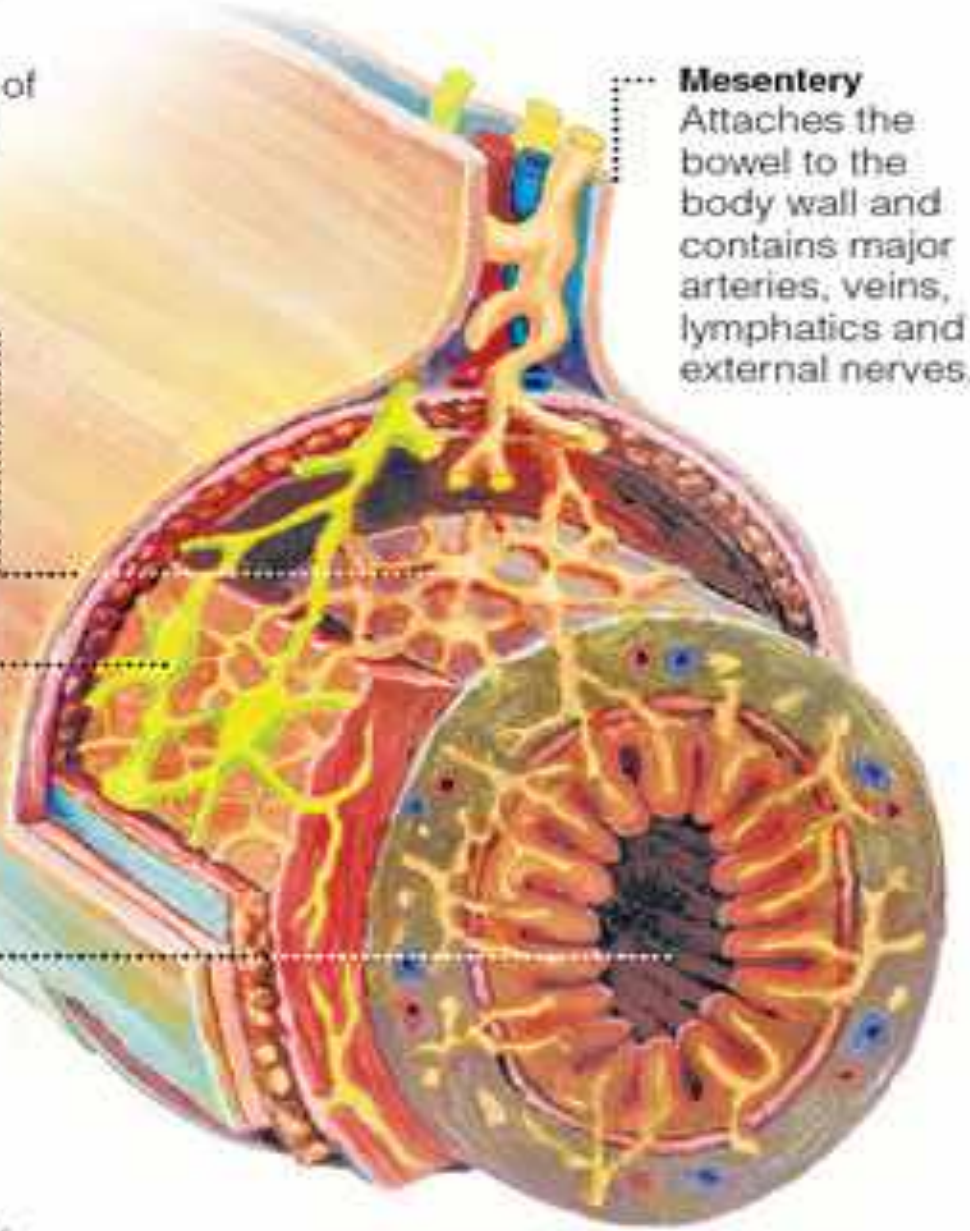
The gut's brain, known as the enteric nervous system, is located in sheaths of tissue lining the esophagus, stomach, small intestine and colon.

SMALL INTESTINE CROSS SECTION

Submucosal plexus Layer contains sensory cells that communicate with the myenteric plexus and motor fibers that stimulate the secretion of fluids into the lumen.

Myenteric plexus Layer contains the neurons responsible for regulating the enzyme output of adjacent organs.

Lumen No nerves actually enter this area, where digestion occurs. The brains in the head and gut have to monitor conditions in the lumen across the lining of the bowel.



Mesentery Attaches the bowel to the body wall and contains major arteries, veins, lymphatics and external nerves.

Enteric Neuroscience

“The study supports the idea that there could be a real biology of gut feelings……. as soon as food contacts the wall of the gut, the brain will know in real time what’s going on in the gut”

-Diego Bohórquez, Assistant Professor of medicine at Duke,
Postdoctoral Researcher in the lab of Dr. Rodger Liddle,
a professor of gastroenterology.

An image taken from 3-D electron microscopy reveals the structure of a Neuropod — a cell in the gut that senses nutrient levels and sends signals that govern appetite, but isn't a neuron.

"Neuroepithelial circuit formed by innervation of sensory enteroendocrine cells"

by Diego V. Bohórquez, Rafiq A. Shahid, Alan Erdmann,
Alex M. Kreger, Yu Wang, Nicole Calakos, Fan Wang and Rodger A. Liddle
in *Journal of Clinical Investigation*. Published online January 2 2015 doi:10.1172/JCI78361

- Several years ago, **Liddle's team developed methods to visualize a type of cell found scattered throughout the lining of the mouse gut that is remarkably similar to a neuron.** Although the cells have a normal shape on the gut's surface, their underside bears a long arm.

- **Dubbed 'Neuropods,' these special arms are nurtured by support cells known as glia that work with neurons, which suggested at the time that they could be involved in a neuronal circuit.**

Intestinal microbiota, probiotics and mental health: from Metchnikoff to modern advances: Part I – autointoxication revisited

Alison C Bested[1], Alan C Logan[2*] and Eva M Selhub[3]

Abstract

society.

One area of flourishing research involves the neuro psychological consequences of alterations to gut micro biota (formerly referred to as "flora" or "microflora") in

nipulation could positively influence mental health, at least within scientific writing, was inevitably linked to the early 20th century, to a time when some within medicine had veered off a rational course in a relatively short lived obsession with so called 'autointoxication' and 'intestinal toxemia' [7 11]. During this period the colon was viewed as the central road to a limitless array

BioMed Central

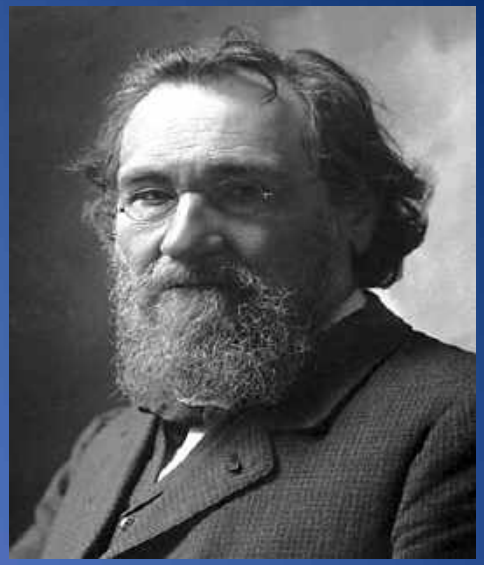
"Mental Health Disorders , depression in particular, have been prescribed as a global epidemic".

"Research suggest that a variety of lifestyle may be driving at least some portion of the increased prevalence".

"One area of flourishing research involves the relationship between the intestinal microbiota (as well as the related functional integrity of the gastrointestinal tract) and mental health".

Élie Metchnikoff

1845 – 1916



- Mechnikov's work on phagocytes won him the Nobel Prize in 1908.
- Immunology (specialist is microbes)
- Credited by some sources with coining the term gerontology in 1903, for the emerging study of aging and longevity.
- Mechnikov also developed a theory that aging is caused by toxic bacteria in the gut and that lactic acid could prolong life. Based on this theory, he drank sour milk every day (Lactobacillus Bulgaricus)

"GABA is made by many bacteria, especially Lactobacilli, and this property may well serve to protect the organism from the acid environment encountered in the stomach, since it synthesis involves proton exchange for the uptake of glutamate."

Higuchi et al.,1997

there is extensive epidemiological evidence to support the view that significant co morbidity exists between many chronic medical and psychiatric diseases, especially mood disorders (Moussavi et al., 2007; Van Lieshout et al., 2008). The severity and prognosis of medical illness are substantially affected by the presence or absence of co morbid depression. For example, depression is a significant risk factor for myocardial infarction (Rosengren et al., 2004) and its presence at the time of infarction predicts a greater than

their application to the study of the human genome have produced much evidence to support the genetic basis of a number of chronic diseases. However, the results are fraught with difficulty of interpretation as well as the knowledge that most of these diseases are polygenic in origin. Indeed the solution to some of the conundra of causation of chronic diseases may lie in greater understanding of the consequences of gene environment interactions (Cooper, 2008). As a result, the field of epigenetics is expanding explosively and is being applied to psychiatric disorders (Mill and Petronis, 2007; Tsankova et al., 2007).

We believe that one of the most significant areas that need to be investigated in terms of potential environmental factors contributing to both mood disorders and chronic diseases is the external

Fermented Milk

- A UCLA study tested how fermented milk affected the brains of women. The women were split into three different groups: one that didn't receive probiotics, one that received non-fermented milk, and one that got fermented milk. Fermented milk can be a great source for probiotics, and some of the strains that are found in fermented milk include:

- Lactobacillus Bulgaricus
- Bifidobacterium Animalis
- Lactococcus Lactis
- Streptococcus Thermophiles

- Consumption of Fermented Milk Product With Probiotic Modulates Brain Activity

- The research showed that the group that received the fermented milk showed better brain function by MRI analaysis.
